**COMMENTS OF KENNETH C. JOHNSON
PERTAINING TO MODELING-RELATED ISSUES**

Kenneth C. Johnson, an unaffiliated individual, U.S. citizen, and resident of California having a personal interest in and concern about climate change, respectfully submits the following comments in response to the *Administrative Law Judge's Ruling Requesting Comments on Modeling-Related Issues* (11/09/2007).

The November 9 ALJ ruling requests comments on the Energy and Environmental Economics, Inc. (E3) modeling methodology. The ruling also seeks comment on the Public Utilities Commission Staff workpaper entitled "Greenhouse Gas Emissions Reduction Measures for the Electricity and Natural Gas Sectors Under Consideration as Part of R.06-04-009," included with the ruling as Attachment A.

Much of the E3 modeling effort is focused on issues of resource availability and costs of technology and infrastructure associated with decarbonization of California's electricity resources. Other issues of importance are the regulatory costs associated with GHG caps and standards, distributional impacts of alternative allocation methods, and the efficacy of regulatory incentives in inducing emission reductions. Regarding regulatory incentives, Attachment A to the ruling states the following:

As many of the opportunities identified on the outer margin of potential emission reduction measures are in early stages of technological development, any GHG framework's ability to stimulate innovation is particularly valuable for capturing these potential reductions. By providing an economic incentive to exceed compliance with existing regulations where possible, a cap and trade program can spur innovation to pursue potentially cost effective opportunities outside the realm of existing control measures.

Under a cap and trade program, marginal incentives for emission reductions are reflected by the emission price, but the economic and practical feasibility of imposing a stringent target and high price can be limited by distributional costs of the regulations. A variety of distributional policy objectives and allocation methodologies were discussed in the October 15 ALJ ruling on allowance allocation issues and in respondents' comments.

These include grandfathering, distribution proportionate to “economic harm”, direct distribution to the public or “in the public interest”, and output-based refunding. The discussions were primarily non-quantitative and conceptual in nature, but serious consideration of any of these proposals requires at least an estimate of the quantitative economic impacts of such policies in terms of both their cost burden and their efficacy in incentivizing decarbonization of electricity generation.

The following comments provide such an estimation for several allocation methods. The purpose of this analysis is not just to advocate a particular allocation method, but rather to propound an accounting methodology that provides a high degree of transparency, accountability, and administrative control over the distributional impacts of regulation. This approach determines not only the total regulatory cost incurred, or gain accrued, by any particular entity, but also provides a complete accounting of where that particular entity’s costs are going or where the subsidies are coming from. Individual cross-subsidies between specific industry sub-sectors can be administratively controlled to manage distributional impacts and regulatory incentives in an efficacious manner.

The analysis applies to a cap-and-trade system with 100% auctioning, but the same principles apply to administrative allowance allocation, which is substantially equivalent to a refunded auction that uses the same proportionate allocation formula for refund distribution. Three policies are modeled, including an unrefunded auction, an auction with 100% output-based refunding, and a modified output-based refunding method that is administratively modified to selectively eliminate large cross-subsidies that do not serve useful policy objectives.

In these examples, the CA 2004 electricity market is subdivided into sub-sectors defined by fuel type. The same approach could be used to further subdivide the market into individual regulated entities or geographic regions and account for cross-subsidies between specific entities or regions. If the auction revenue is not all returned to the regulated sector, then the state or any beneficiaries of the revenue should be included in the accounting, which should specify what portion of any particular entity’s regulatory cost goes to any such beneficiary.

The analysis approach can be extended to cover CHP or other types of industrial combustion, e.g., by defining a MWh-equivalent valuation metric for usable heat output.

The data for the analysis was recently provided by ARB in two spreadsheets, one that provides a breakdown of California electricity generation and emission by fuel type, and one that provides a similar breakdown of California electricity imports.¹ The data is tabulated in Appendix A.

Table 1 shows a fuel breakdown of the 2004 CA electricity market in terms of generation, emissions, and emission intensity. Table 2 shows what the regulatory costs would be for an unrefunded auction with an emission price of \$10 per MTCO₂e.

Industry-average emission charges would be \$4.05/MWh, and aggregate revenue would be \$1.2 billion.

Under a refunded auction with pure output-based allocation the revenue would be distributed to regulated entities in proportion to generation output, at a refund rate (\$4.05/MWh) determined to achieve revenue neutrality. This is shown in Table 3. (The formulas underlying Table 3 are outlined in the Appendix B.) Marginal incentives for emission intensity reduction would not be affected by the refund, and the relative competitiveness of alternative fuels would not be affected, but regulatory costs would be greatly diminished (e.g. the emission charge for CA Coal would be reduced from \$11.55/MWh to \$7.50/MWh, and non-emitting sources receive subsidies of \$4.05/MWh).

The aggregate net emission charges in Table 3 can be disaggregated into individual cross-sector revenue flows, shown in Table 4. For example, there would be a \$103.31 million cross-subsidy from Import Coal to CA NG. (The disaggregation formula is outlined in Appendix B.) If the auction is not revenue-neutral within the electricity sector, then this table would be augmented with additional rows and columns to account for all additional revenue sources and sinks.

¹ This data was received from Larry Hunsaker (lhunsake@arb.ca.gov) on Nov. 27, 2007. The file names are Electricity Generation (November 27, 2007).xls
Electricity Profile for CA Imports (November 26, 2007).xls
Mr. Hunsaker noted that “This is an update to the frozen numbers on our site which we will go to the Board with, this update will make its way into future inventory improvements ...”

Table 3. Pure output-based refund allocation at \$10/MTCO₂e.

Table 3 shows that Hydro and Nuclear would receive large subsidies (\$4.05/MWh), primarily from Coal and NG (cf. Table 4). Unless it is a policy objective to expand Hydro and Nuclear to replace Coal and NG, this subsidy does not serve a useful purpose – it only diverts economic resources that might be more usefully spent on sequestration or renewable energy. (For simplicity, this analysis assumes that “non-emitting” imports are Hydro or Nuclear, and no distinction is made between small and large Hydro.) Also, the cross subsidy from Coal to NG may be counterproductive because of the economic impact of NG demand on other industries that rely on NG, and because substitution of NG for Coal is not a viable long-term decarbonization strategy. Therefore, it may be advantageous to selectively eliminate these cross-subsidies, as illustrated in Table 5 (shaded cells). Alternatively, the cross-subsidies might be phased in over a period of time, gradually evolving toward pure output-based allocation.

Table 6 shows the effect of the cross-subsidy elimination on regulatory costs. The net charges per MWh (middle column) are reduced substantially for both Coal and NG. (Compare Net Charge columns in Tables 3 and 6.) Hydro and Nuclear subsidies are eliminated, there is no change for Wind/Solar, and the net subsidies for Biomass and Geothermal are slightly increased because they are not subsidizing Hydro and Nuclear.

Table 6. Modified output-based allocation at \$10/MTCO2e.

All of the dollar-dimensioned values in the above tables scale in proportion to the emission price, assumed here to be \$10/MTCO2e. By mitigating the distributional impacts of regulation, it becomes possible to apply a more stringent cap (or higher price floor) consistent with the 2020 emission target and with the AB 32 mandate requiring “the maximum technologically feasible and cost-effective greenhouse gas emission reductions”.

Respectfully submitted,

/s/ Kenneth C. Johnson

Appendix B: Calculation formulas for output-based refund allocation.

A conceptual overview of the output-based allocation method is provided in my November 12, 2007 reply comments (Appendix) responding to the October 15 ALJ ruling on allowance allocation issues. Following the same notation conventions, the electricity sector is segmented into sub-sectors Coal, NG, etc. which will be indicated by the symbol S . During a particular compliance period, sub-sector S generates emissions $E^{[S]}$ in connection with generation output $Q^{[S]}$. The auction effectively imposes a tax $T^{[S]}$ on the emissions from S , and the refund to S is $R^{[S]}$. Aggregate quantities over the entire electricity sector are indicated without the superscript,

$$E = \sum_S E^{[S]}, \quad Q = \sum_S Q^{[S]} \\ T = \sum_S T^{[S]}, \quad R = \sum_S R^{[S]}$$

For simplicity, it is assumed that a uniform emission price p applies to all emissions; and a uniform refund rate c applies to generation output,

$$T^{[S]} = p E^{[S]}$$

$$R^{[S]} = c Q^{[S]}$$

(As noted in my November 12 reply comments, the refund rate should be prorated to the price if the latter is nonuniform.) Based on the revenue-neutrality condition, the refund rate is equal to the price times the electricity sector's aggregate emission intensity,

$$R = T \rightarrow c = p \frac{E}{Q}$$

The Refund (\$/MWh) column in Table 3 is based on the above equation.

The net emission charge aggregated over sub-sector S , denoted as $F^{[S]}$, is

$$F^{[S]} = T^{[S]} - R^{[S]} = p E^{[S]} - c Q^{[S]}$$

Substituting the preceding equations for c , E and Q , the emission charge $F^{[S]}$ can be represented as a sum of cross-subsidies $F^{[S \rightarrow S']}$ between sub-sectors S and S' ,

$$F^{[S]} = \sum_{S'} F^{[S \rightarrow S']}$$

wherein

$$F^{[S \rightarrow S']} = p \left(\frac{E^{[S]}}{Q^{[S]}} - \frac{E^{[S']}}{Q^{[S']}} \right) \frac{Q^{[S]} Q^{[S']}}{Q}$$

Table 4 is based on this equation. (Note that the above cross-subsidy is proportionate to the difference in emission intensity between sub-sectors S and S' , with the direction of revenue flow depending on which sub-sector has better emission performance.)

After the highlighted modifications in Table 5 are made, the redefined $F^{[S \rightarrow S']}$ terms in each table row are summed over S' to determine $F^{[S]}$. This is the Aggregate Net Charge (M\$) in Table 6. The Net Charge (\$/MWh) is $F^{[S]} / Q^{[S]}$. A revised refund rate $c^{[S]}$ for sub-sector S is defined according to the relation,

$$F^{[S]} = p E^{[S]} - c^{[S]} Q^{[S]}$$

This yields

$$c^{[S]} = \frac{p E^{[S]} - F^{[S]}}{Q^{[S]}}$$

This is the Refund (\$/MWh) column in Table 6.

CERTIFICATE OF SERVICE

I hereby certify that I have this day served a copy of COMMENTS OF KENNETH C. JOHNSON PERTAINING TO MODELING-RELATED ISSUES on the service list for CPUC Docket No. R.06-04-009 and CEC Docket No. 07-OIIP-01 by serving a copy to each party by electronic mail and/or by mailing a properly addressed copy by first-class mail with postage prepaid.

Executed on December 3, 2007, at Santa Clara, California.

/s/ Kenneth C. Johnson
